Given a flow network for a standard maxflow problem.

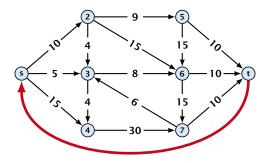

15 Mincost Flow

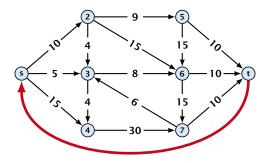

- Given a flow network for a standard maxflow problem.
- Set b(v) = 0 for every node. Keep the capacity function u for all edges. Set the cost c(e) for every edge to 0.

- Given a flow network for a standard maxflow problem.
- Set b(v) = 0 for every node. Keep the capacity function u for all edges. Set the cost c(e) for every edge to 0.
- Add an edge from t to s with infinite capacity and cost -1.

- Given a flow network for a standard maxflow problem.
- Set b(v) = 0 for every node. Keep the capacity function u for all edges. Set the cost c(e) for every edge to 0.
- Add an edge from t to s with infinite capacity and cost -1.
- Then, $val(f^*) = -cost(f_{min})$, where f^* is a maxflow, and f_{min} is a mincost-flow.

- Given a flow network for a standard maxflow problem, and a value k.
- Set b(v) = 0 for every node apart from s or t. Set b(s) = −k and b(t) = k.
- Set edge-costs to zero, and keep the capacities.
- There exists a maxflow of value k if and only if the mincost-flow problem is feasible.

The residual graph for a mincost flow is exactly defined as the residual graph for standard flows, with the only exception that one needs to define a cost for the residual edge.

For a flow of z from u to v the residual edge (v, u) has capacity z and a cost of -c((u, v)).

The residual graph for a mincost flow is exactly defined as the residual graph for standard flows, with the only exception that one needs to define a cost for the residual edge.

For a flow of z from u to v the residual edge (v, u) has capacity z and a cost of -c((u, v)).

A circulation in a graph G = (V, E) is a function $f : E \to \mathbb{R}^+$ that has an excess flow f(v) = 0 for every node $v \in V$.

A circulation is feasible if it fulfills capacity constraints, i.e., $f(e) \le u(e)$ for every edge of G.

15 Mincost Flow

A circulation in a graph G = (V, E) is a function $f : E \to \mathbb{R}^+$ that has an excess flow f(v) = 0 for every node $v \in V$.

A circulation is feasible if it fulfills capacity constraints, i.e., $f(e) \le u(e)$ for every edge of *G*.

A given flow is a mincost-flow if and only if the corresponding residual graph G_f does not have a feasible circulation of negative cost.

Suppose that φ is a feasible circulation of negative cost in the residual graph.

Let () be a non-mincost flow, and let () be a min-cost flow.
We need to show that the residual graph has a feasible circulation with negative cost.

A given flow is a mincost-flow if and only if the corresponding residual graph G_f does not have a feasible circulation of negative cost.

⇒ Suppose that g is a feasible circulation of negative cost in the residual graph.

Then f + g is a feasible flow with cost cost(f) + cost(g) < cost(f). Hence, f is not minimum cost.

⇐ Let f be a non-mincost flow, and let f* be a min-cost flow.
We need to show that the residual graph has a feasible circulation with negative cost.

Clearly (2) = 20 is a circulation of negative cost. One can also easily see that it is feasible for the residual graph. (after sending = 20 in the residual graph (pushing all flow back)we arrive at the original graph; for this (20 is clearly feasible)

A given flow is a mincost-flow if and only if the corresponding residual graph G_f does not have a feasible circulation of negative cost.

⇒ Suppose that g is a feasible circulation of negative cost in the residual graph.

Then f + g is a feasible flow with cost cost(f) + cost(g) < cost(f). Hence, f is not minimum cost.

⇐ Let f be a non-mincost flow, and let f* be a min-cost flow.
We need to show that the residual graph has a feasible circulation with negative cost.

Clearly (2) = 20 is a circulation of negative cost. One can also easily see that it is feasible for the residual graph. (after sending = 20 in the residual graph (pushing all flow back)we arrive at the original graph; for this (20 is clearly feasible)

A given flow is a mincost-flow if and only if the corresponding residual graph G_f does not have a feasible circulation of negative cost.

⇒ Suppose that g is a feasible circulation of negative cost in the residual graph.

Then f + g is a feasible flow with cost cost(f) + cost(g) < cost(f). Hence, f is not minimum cost.

⇐ Let f be a non-mincost flow, and let f* be a min-cost flow.
We need to show that the residual graph has a feasible circulation with negative cost.

Clearly $f^* - f$ is a circulation of negative cost. One can also easily see that it is feasible for the residual graph. (after sending -f in the residual graph (pushing all flow back) we arrive at the original graph; for this f^* is clearly feasible)

A given flow is a mincost-flow if and only if the corresponding residual graph G_f does not have a feasible circulation of negative cost.

⇒ Suppose that g is a feasible circulation of negative cost in the residual graph.

Then f + g is a feasible flow with cost cost(f) + cost(g) < cost(f). Hence, f is not minimum cost.

⇐ Let f be a non-mincost flow, and let f* be a min-cost flow.
We need to show that the residual graph has a feasible circulation with negative cost.

Clearly $f^* - f$ is a circulation of negative cost. One can also easily see that it is feasible for the residual graph. (after sending -f in the residual graph (pushing all flow back) we arrive at the original graph; for this f^* is clearly feasible)

Lemma 2

A graph (without zero-capacity edges) has a feasible circulation of negative cost if and only if it has a negative cycle w.r.t. edge-weights $c : E \to \mathbb{R}$.

- Suppose that we have a negative cost circulation...
- Find directed path only using edges that have non-zero flow.
- If this path has negative cost you are done.
- Otherwise send flow in opposite direction along the cycle until the bottleneck edge(s) does not carry any flow.
- You still have a circulation with negative cost.
- Repeat.

Lemma 2

- You still have a circulation with negative cost.
- Repeat.

Algorithm 51 CycleCanceling(G = (V, E), c, u, b)

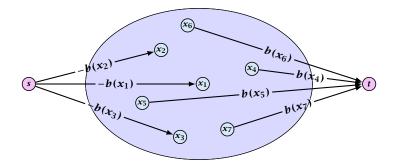

- 1: establish a feasible flow f in G
- 2: while G_f contains negative cycle do
- 3: use Bellman-Ford to find a negative circuit Z

4:
$$\delta \leftarrow \min\{u_f(e) \mid e \in Z\}$$

5: augment δ units along Z and update G_f

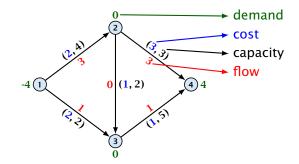

How do we find the initial feasible flow?

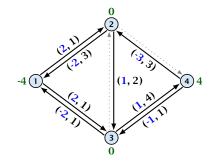

- Connect new node s to all nodes with negative b(v)-value.
- Connect nodes with positive b(v)-value to a new node t.
- There exist a feasible flow in the original graph iff in the resulting graph there exists an *s*-*t* flow of value

$$\sum_{\nu:b(\nu)<0} (-b(\nu)) = \sum_{\nu:b(\nu)>0} b(\nu) \; .$$

Lemma 3

The improving cycle algorithm runs in time $O(nm^2CU)$, for integer capacities and costs, when for all edges e, $|c(e)| \le C$ and $|u(e)| \le U$.

- Running time of Bellman-Ford is $\mathcal{O}(mn)$.
- Pushing flow along the cycle can be done in time O(n).
- Each iteration decreases the total cost by at least 1.
- The true optimum cost must lie in the interval [-mCU, ..., +mCU].

Note that this lemma is weak since it does not allow for edges with infinite capacity.

A general mincost flow problem is of the following form:

min
$$\sum_{e} c(e) f(e)$$

s.t. $\forall e \in E : \ell(e) \le f(e) \le u(e)$
 $\forall v \in V : a(v) \le f(v) \le b(v)$

where $a: V \to \mathbb{R}$, $b: V \to \mathbb{R}$; $\ell: E \to \mathbb{R} \cup \{-\infty\}$, $u: E \to \mathbb{R} \cup \{\infty\}$ $c: E \to \mathbb{R}$;

Lemma 4 (without proof)

A general mincost flow problem can be solved in polynomial time.
