We first solve the LP-relaxation and then we round the fractional values so that we obtain an integral solution.

Set Cover relaxation:

$$\begin{array}{c|cccc} \min & & \sum_{i=1}^k w_i x_i \\ \text{s.t.} & \forall u \in U & \sum_{i:u \in S_i} x_i & \geq & 1 \\ & \forall i \in \{1,\dots,k\} & & x_i & \in & [0,1] \\ \end{array}$$

Let f_u be the number of sets that the element u is contained in (the frequency of u). Let $f = \max_u \{f_u\}$ be the maximum frequency.

We first solve the LP-relaxation and then we round the fractional values so that we obtain an integral solution.

Set Cover relaxation:

$$\begin{array}{|c|c|c|c|c|} \min & \sum_{i=1}^k w_i x_i \\ \text{s.t.} & \forall u \in U & \sum_{i:u \in S_i} x_i \geq 1 \\ & \forall i \in \{1,\dots,k\} & x_i \in [0,1] \\ \end{array}$$

Let f_u be the number of sets that the element u is contained in (the frequency of u). Let $f = \max_u \{f_u\}$ be the maximum frequency.

We first solve the LP-relaxation and then we round the fractional values so that we obtain an integral solution.

Set Cover relaxation:

$$\begin{array}{|c|c|c|c|c|}\hline \min & & \sum_{i=1}^k w_i x_i \\ \text{s.t.} & \forall u \in U & \sum_{i:u \in S_i} x_i & \geq & 1 \\ & \forall i \in \{1,\dots,k\} & x_i & \in & [0,1] \\ \hline \end{array}$$

Let f_u be the number of sets that the element u is contained in (the frequency of u). Let $f = \max_u \{f_u\}$ be the maximum frequency.

Rounding Algorithm:

Set all x_i -values with $x_i \ge \frac{1}{f}$ to 1. Set all other x_i -values to 0.

Lemma 2

The rounding algorithm gives an f-approximation.

Proof: Every $u \in U$ is covered.

We know that

The sum contains at most //

Therefore one of the sets three

This set will be selected. Hence, was covered

Lemma 2

The rounding algorithm gives an f-approximation.

Lemma 2

The rounding algorithm gives an f-approximation.

- We know that $\sum_{i:u\in S_i} x_i \geq 1$.
- ▶ The sum contains at most $f_u \le f$ elements.
- ▶ Therefore one of the sets that contain u must have $x_i \ge 1/f$.
- ▶ This set will be selected. Hence, *u* is covered.

Lemma 2

The rounding algorithm gives an f-approximation.

- ▶ We know that $\sum_{i:u\in S_i} x_i \ge 1$.
- ▶ The sum contains at most $f_u \le f$ elements.
- ▶ Therefore one of the sets that contain u must have $x_i \ge 1/f$.
- ▶ This set will be selected. Hence, *u* is covered.

Lemma 2

The rounding algorithm gives an f-approximation.

- We know that $\sum_{i:u\in S_i} x_i \geq 1$.
- ▶ The sum contains at most $f_u \le f$ elements.
- ▶ Therefore one of the sets that contain u must have $x_i \ge 1/f$.
- This set will be selected. Hence, u is covered.

Lemma 2

The rounding algorithm gives an f-approximation.

- We know that $\sum_{i:u\in S_i} x_i \geq 1$.
- ▶ The sum contains at most $f_u \le f$ elements.
- ▶ Therefore one of the sets that contain u must have $x_i \ge 1/f$.
- ▶ This set will be selected. Hence, *u* is covered.

$$\sum_{i\in I} w_i$$

s.t. $\forall i \sum_{u:u \in S_i} y_u \leq w_i$

$$y_u \geq 0$$

Rounding Algorithm:

Let I denote the index set of sets for which the dual constraint is tight. This means for all $i \in I$

$$\sum_{u:u\in S_i} y_u = w_i$$

Lemma 3

The resulting index set is an f-approximation.

Proof:

```
Suppose there is a u that is not covered
```

```
This means we we for all sets to that containing
```

```
But then we could be increased in the dual solution without
```

```
that the dual solution is optimal.
```

Lemma 3

The resulting index set is an f-approximation.

Proof:

Lemma 3

The resulting index set is an f-approximation.

Proof:

- Suppose there is a u that is not covered.
- ▶ This means $\sum_{u:u \in S_i} y_u < w_i$ for all sets S_i that contain u.
- ▶ But then y_u could be increased in the dual solution without violating any constraint. This is a contradiction to the fact that the dual solution is optimal.

Lemma 3

The resulting index set is an f-approximation.

Proof:

- Suppose there is a u that is not covered.

Algorithm 1 PrimalDual

1: $y \leftarrow 0$

2: *I* ← Ø

3: while exists $u \notin \bigcup_{i \in I} S_i$ do

4: increase dual variable y_u until constraint for some new set S_ℓ becomes tight

5: $I \leftarrow I \cup \{\ell\}$

Algorithm 1 Greedy

Algorithm I Greedy

1:
$$I \leftarrow \emptyset$$
2: $\hat{S}_j \leftarrow S_j$ for all j
3: while I not a set cover do
4: $\ell \leftarrow \arg\min_{j:\hat{S}_j \neq 0} \frac{w_j}{|\hat{S}_j|}$
5: $I \leftarrow I \cup \{\ell\}$
6: $\hat{S}_j \leftarrow \hat{S}_j - S_\ell$ for all j

5:
$$I \leftarrow I \cup \{\ell\}$$

6:
$$\hat{S}_j \leftarrow \hat{S}_j - S_\ell$$
 for all j

In every round the Greedy algorithm takes the set that covers remaining elements in the most cost-effective way.

We choose a set such that the ratio between cost and still uncovered elements in the set is minimized.

Lemma 4

Given positive numbers $a_1, ..., a_k$ and $b_1, ..., b_k$, and $S \subseteq \{1, ..., k\}$ then

$$\min_{i} \frac{a_i}{b_i} \le \frac{\sum_{i \in S} a_i}{\sum_{i \in S} b_i} \le \max_{i} \frac{a_i}{b_i}$$

Let n_ℓ denote the number of elements that remain at the beginning of iteration ℓ . $n_1=n=|U|$ and $n_{s+1}=0$ if we need s iterations.

In the ℓ -th iteration

since an optimal algorithm can cover the remaining n_ℓ elements with cost OPT.

Let \hat{S}_j be a subset that minimizes this ratio. Hence, $w_j/|\hat{S}_j| \leq \frac{\mathrm{OPT}}{n_\ell}$.

Let n_ℓ denote the number of elements that remain at the beginning of iteration ℓ . $n_1=n=|U|$ and $n_{s+1}=0$ if we need s iterations.

In the **ℓ**-th iteration

$$\min_{j} \frac{w_{j}}{|\hat{S}_{j}|} \leq \frac{\sum_{j \in \text{OPT}} w_{j}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} = \frac{\text{OPT}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} \leq \frac{\text{OPT}}{n_{\ell}}$$

since an optimal algorithm can cover the remaining n_ℓ elements with cost OPT.

Let \hat{S}_j be a subset that minimizes this ratio. Hence, $w_j/|\hat{S}_j| \leq \frac{\mathrm{OPT}}{n_s}$.

Let n_ℓ denote the number of elements that remain at the beginning of iteration ℓ . $n_1=n=|U|$ and $n_{s+1}=0$ if we need s iterations.

In the **ℓ**-th iteration

$$\min_{j} \frac{w_{j}}{|\hat{S}_{j}|} \leq \frac{\sum_{j \in \text{OPT}} w_{j}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} = \frac{\text{OPT}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} \leq \frac{\text{OPT}}{n_{f}}$$

since an optimal algorithm can cover the remaining n_ℓ elements with cost OPT.

Let \hat{S}_j be a subset that minimizes this ratio. Hence, $w_j/|\hat{S}_j| \leq \frac{\mathrm{OPT}}{n_o}$.

Let n_ℓ denote the number of elements that remain at the beginning of iteration ℓ . $n_1=n=|U|$ and $n_{s+1}=0$ if we need s iterations.

In the ℓ-th iteration

$$\min_{j} \frac{w_{j}}{|\hat{S}_{j}|} \leq \frac{\sum_{j \in \text{OPT}} w_{j}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} = \frac{\text{OPT}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} \leq \frac{\text{OPT}}{n_{\ell}}$$

since an optimal algorithm can cover the remaining n_ℓ elements with cost OPT.

Let \hat{S}_j be a subset that minimizes this ratio. Hence, $w_j/|\hat{S}_j| \leq \frac{\mathrm{OPT}}{n_o}$.

Let n_ℓ denote the number of elements that remain at the beginning of iteration ℓ . $n_1=n=|U|$ and $n_{s+1}=0$ if we need s iterations.

In the ℓ-th iteration

$$\min_{j} \frac{w_{j}}{|\hat{S}_{j}|} \leq \frac{\sum_{j \in \text{OPT}} w_{j}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} = \frac{\text{OPT}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} \leq \frac{\text{OPT}}{n_{\ell}}$$

since an optimal algorithm can cover the remaining n_ℓ elements with cost OPT.

Let \hat{S}_j be a subset that minimizes this ratio. Hence, $w_j/|\hat{S}_j| \leq \frac{\mathrm{OPT}}{n_e}$.

Let n_ℓ denote the number of elements that remain at the beginning of iteration ℓ . $n_1=n=|U|$ and $n_{s+1}=0$ if we need s iterations.

In the ℓ-th iteration

$$\min_{j} \frac{w_{j}}{|\hat{S}_{j}|} \leq \frac{\sum_{j \in \text{OPT}} w_{j}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} = \frac{\text{OPT}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} \leq \frac{\text{OPT}}{n_{\ell}}$$

since an optimal algorithm can cover the remaining n_ℓ elements with cost $\mbox{OPT}.$

Let \hat{S}_j be a subset that minimizes this ratio. Hence, $w_i/|\hat{S}_i| \leq \frac{\text{OPT}}{n_r}$.

Let n_ℓ denote the number of elements that remain at the beginning of iteration ℓ . $n_1=n=|U|$ and $n_{s+1}=0$ if we need s iterations.

In the ℓ-th iteration

$$\min_{j} \frac{w_{j}}{|\hat{S}_{j}|} \leq \frac{\sum_{j \in \text{OPT}} w_{j}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} = \frac{\text{OPT}}{\sum_{j \in \text{OPT}} |\hat{S}_{j}|} \leq \frac{\text{OPT}}{n_{\ell}}$$

since an optimal algorithm can cover the remaining n_ℓ elements with cost OPT .

Let \hat{S}_j be a subset that minimizes this ratio. Hence, $w_j/|\hat{S}_j| \leq \frac{\text{OPT}}{n_\ell}$.

Adding this set to our solution means $n_{\ell+1} = n_{\ell} - |\hat{S}_j|$.

$$w_j \le \frac{|\hat{S}_j| \text{OPT}}{n_\ell} = \frac{n_\ell - n_{\ell+1}}{n_\ell} \cdot \text{OPT}$$

Adding this set to our solution means $n_{\ell+1} = n_{\ell} - |\hat{S}_j|$.

Lemma 5

With high probability $O(\log n)$ rounds suffice.

- = $\Pr[u_1 \text{ not covered} \lor u_2 \text{ not covered} \lor ... \lor u_n \text{ not covered}]$
- $\leq \sum_{i} \Pr[u_i \text{ not covered after } \ell \text{ rounds}] \leq ne^{-\ell}$.

Lemma 5

With high probability $O(\log n)$ rounds suffice.

With high probability:

For any constant α the number of rounds is at most $\mathcal{O}(\log n)$ with probability at least $1 - n^{-\alpha}$.

Proof: We have

$$\Pr[\#\text{rounds} \ge (\alpha + 1) \ln n] \le ne^{-(\alpha+1) \ln n} = n^{-\alpha}$$
.

Version A. Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply take for each element u the cheapest set that contains u.

Version A. Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply take for each element u the cheapest set that contains u.

E[cost]

Version A. Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply take for each element u the cheapest set that contains u.

$$E[\cos t] \le (\alpha + 1) \ln n \cdot \cos t(LP) + (n \cdot OPT) n^{-\alpha}$$

Version A. Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply take for each element u the cheapest set that contains u.

 $E[\cos t] \le (\alpha + 1) \ln n \cdot \cos t(LP) + (n \cdot OPT) n^{-\alpha} = \mathcal{O}(\ln n) \cdot OPT$

Version B. Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply repeat the whole process.

E[cost] =

Version B. Repeat for $s = (\alpha + 1) \ln n$ rounds. If you don't have a cover simply repeat the whole process.

```
E[\cos t] = \Pr[success] \cdot E[\cos t \mid success] + \Pr[no success] \cdot E[\cos t \mid no success]
```

Version B.

Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply repeat the whole process.

```
E[\cos t] = \Pr[success] \cdot E[\cos t \mid success] \\ + \Pr[no \ success] \cdot E[\cos t \mid no \ success]
```

This means

E[cost | success]

Version B.

Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply repeat the whole process.

$$E[\cos t] = \Pr[success] \cdot E[\cos t \mid success] + \Pr[no success] \cdot E[\cos t \mid no success]$$

This means

$$\begin{split} E[\cos t \mid & success] \\ &= \frac{1}{\Pr[succ.]} \Big(E[\cos t] - \Pr[no \ success] \cdot E[\cos t \mid no \ success] \Big) \end{split}$$

Version B.

Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply repeat the whole process.

$$E[\cos t] = \Pr[success] \cdot E[\cos t \mid success] + \Pr[no success] \cdot E[\cos t \mid no success]$$

This means

$$\begin{split} E[\cos t \mid & \mathsf{success}] \\ &= \frac{1}{\Pr[\mathsf{succ.}]} \Big(E[\cos t] - \Pr[\mathsf{no} \ \mathsf{success}] \cdot E[\cos t \mid \mathsf{no} \ \mathsf{success}] \Big) \\ &\leq \frac{1}{\Pr[\mathsf{succ.}]} E[\cos t] \leq \frac{1}{1 - n^{-\alpha}} (\alpha + 1) \ln n \cdot \mathsf{cost}(\mathsf{LP}) \end{split}$$

Version B.

Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply repeat the whole process.

$$E[\cos t] = \Pr[success] \cdot E[\cos t \mid success] \\ + \Pr[no \ success] \cdot E[\cos t \mid no \ success]$$

This means

$$\begin{split} E[\cos t \mid & \mathsf{success}] \\ &= \frac{1}{\Pr[\mathsf{succ.}]} \Big(E[\cos t] - \Pr[\mathsf{no} \ \mathsf{success}] \cdot E[\cos t \mid \mathsf{no} \ \mathsf{success}] \Big) \\ &\leq \frac{1}{\Pr[\mathsf{succ.}]} E[\cos t] \leq \frac{1}{1 - n^{-\alpha}} (\alpha + 1) \ln n \cdot \mathsf{cost}(\mathsf{LP}) \\ &\leq 2(\alpha + 1) \ln n \cdot \mathsf{OPT} \end{split}$$

Version B.

Repeat for $s=(\alpha+1)\ln n$ rounds. If you don't have a cover simply repeat the whole process.

$$E[\cos t] = \Pr[success] \cdot E[\cos t \mid success] + \Pr[no success] \cdot E[\cos t \mid no success]$$

This means

$$\begin{split} E[\cos t \mid & \mathsf{success}] \\ &= \frac{1}{\Pr[\mathsf{succ.}]} \Big(E[\cos t] - \Pr[\mathsf{no} \ \mathsf{success}] \cdot E[\cos t \mid \mathsf{no} \ \mathsf{success}] \Big) \\ &\leq \frac{1}{\Pr[\mathsf{succ.}]} E[\cos t] \leq \frac{1}{1 - n^{-\alpha}} (\alpha + 1) \ln n \cdot \mathsf{cost}(\mathsf{LP}) \\ &\leq 2(\alpha + 1) \ln n \cdot \mathsf{OPT} \end{split}$$

for $n \ge 2$ and $\alpha \ge 1$.

Randomized rounding gives an $\mathcal{O}(\log n)$ approximation. The running time is polynomial with high probability.

Theorem 6 (without proof)

There is no approximation algorithm for set cover with approximation guarantee better than $\frac{1}{2}\log n$ unless NP has quasi-polynomial time algorithms (algorithms with running time $\operatorname{poly}(\log n)$)

Randomized rounding gives an $\mathcal{O}(\log n)$ approximation. The running time is polynomial with high probability.

Theorem 6 (without proof)

There is no approximation algorithm for set cover with approximation guarantee better than $\frac{1}{2}\log n$ unless NP has quasi-polynomial time algorithms (algorithms with running time $2^{\text{poly}(\log n)}$).

Integrality Gap

The integrality gap of the SetCover LP is $\Omega(\log n)$.

- $n = 2^k 1$
- ► Elements are all vectors \vec{x} over GF[2] of length k (excluding zero vector).
- Every vector \vec{y} defines a set as follows

$$S_{\vec{y}} := \{ \vec{x} \mid \vec{x}^T \vec{y} = 1 \}$$

- each set contains 2^{k-1} vectors; each vector is contained in 2^{k-1} sets
- $x_i = \frac{1}{2^{k-1}} = \frac{2}{n+1}$ is fractional solution.

Integrality Gap

Every collection of p < k sets does not cover all elements.

Hence, we get a gap of $\Omega(\log n)$.

Techniques:

- Deterministic Rounding
- Rounding of the Dual
- Primal Dual
- Greedy
- Randomized Rounding
- Local Search
- Rounding Data + Dynamic Programming
