Strong Duality

Theorem 2 (Strong Duality)

Let P and D be a primal dual pair of linear programs, and let z^* and w^* denote the optimal solution to P and D, respectively. Then

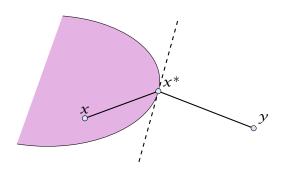

$$z^* = w^*$$

85

Lemma 4 (Projection Lemma)

Let $X \subseteq \mathbb{R}^m$ be a non-empty convex set, and let $y \notin X$. Then there exist $x^* \in X$ with minimum distance from y. Moreover for all $x \in X$ we have $(y - x^*)^T (x - x^*) \le 0$.

Lemma 3 (Weierstrass)

Let X be a compact set and let f(x) be a continuous function on X. Then $\min\{f(x):x\in X\}$ exists.

5.4 Strong Duality B

. . .

Proof of the Projection Lemma

- $\blacktriangleright \ \, \mathsf{Define} \, f(x) = \|y x\|.$
- ▶ We want to apply Weierstrass but *X* may not be bounded.
- ▶ $X \neq \emptyset$. Hence, there exists $x' \in X$.
- ▶ Define $X' = \{x \in X \mid \|y x\| \le \|y x'\|\}$. This set is closed and bounded.
- Applying Weierstrass gives the existence.

87

Proof of the Projection Lemma (continued)

 x^* is minimum. Hence $||y - x^*||^2 \le ||y - x||^2$ for all $x \in X$.

By convexity: $x \in X$ then $x^* + \epsilon(x - x^*) \in X$ for all $0 \le \epsilon \le 1$.

$$||y - x^*||^2 \le ||y - x^* - \epsilon(x - x^*)||^2$$

$$= ||y - x^*||^2 + \epsilon^2 ||x - x^*||^2 - 2\epsilon(y - x^*)^T (x - x^*)$$

Hence, $(y - x^*)^T (x - x^*) \le \frac{1}{2} \epsilon ||x - x^*||^2$.

Letting $\epsilon \to 0$ gives the result.

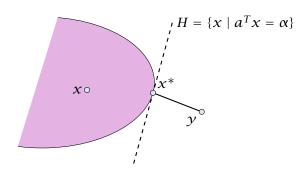

5.4 Strong Duality B

91

Proof of the Hyperplane Lemma

- ▶ Let $x^* \in X$ be closest point to y in X.
- ▶ By previous lemma $(y x^*)^T (x x^*) \le 0$ for all $x \in X$.
- Choose $a = (x^* y)$ and $\alpha = a^T x^*$.
- For $x \in X$: $a^T(x x^*) \ge 0$, and, hence, $a^Tx \ge \alpha$.
- Also, $a^T y = a^T (x^* a) = \alpha ||a||^2 < \alpha$

Theorem 5 (Separating Hyperplane)

Let $X \subseteq \mathbb{R}^m$ be a non-empty closed convex set, and let $y \notin X$. Then there exists a separating hyperplane $\{x \in \mathbb{R} : a^Tx = \alpha\}$ where $a \in \mathbb{R}^m$, $\alpha \in \mathbb{R}$ that separates y from X. ($a^Ty < \alpha$; $a^Tx \ge \alpha$ for all $x \in X$)

5.4 Strong Duality B

. . .

Lemma 6 (Farkas Lemma)

Let A be an $m \times n$ matrix, $b \in \mathbb{R}^m$. Then exactly one of the following statements holds.

- 1. $\exists x \in \mathbb{R}^n$ with Ax = b, $x \ge 0$
- **2.** $\exists \gamma \in \mathbb{R}^m$ with $A^T \gamma \geq 0$, $b^T \gamma < 0$

Assume \hat{x} satisfies 1. and \hat{y} satisfies 2. Then

$$0 > y^T b = y^T A x \ge 0$$

Hence, at most one of the statements can hold.

Proof of Farkas Lemma

Now, assume that 1. does not hold.

Consider $S = \{Ax : x \ge 0\}$ so that S closed, convex, $b \notin S$.

We want to show that there is y with $A^T y \ge 0$, $b^T y < 0$.

Let y be a hyperplane that separates b from S. Hence, $y^Tb < \alpha$ and $y^Ts \ge \alpha$ for all $s \in S$.

$$0 \in S \Rightarrow \alpha \le 0 \Rightarrow y^T b < 0$$

 $y^T A x \ge \alpha$ for all $x \ge 0$. Hence, $y^T A \ge 0$ as we can choose x arbitrarily large.

Proof of Strong Duality

$$P: z = \max\{c^T x \mid Ax \le b, x \ge 0\}$$

$$D: w = \min\{b^T y \mid A^T y \ge c, y \ge 0\}$$

Theorem 8 (Strong Duality)

Let P and D be a primal dual pair of linear programs, and let z and w denote the optimal solution to P and D, respectively (i.e., P and D are non-empty). Then

$$z=w$$
.

Lemma 7 (Farkas Lemma; different version)

Let A be an $m \times n$ matrix, $b \in \mathbb{R}^m$. Then exactly one of the following statements holds.

- 1. $\exists x \in \mathbb{R}^n$ with $Ax \leq b$, $x \geq 0$
- **2.** $\exists y \in \mathbb{R}^m$ with $A^T y \ge 0$, $b^T y < 0$, $y \ge 0$

Rewrite the conditions:

1.
$$\exists x \in \mathbb{R}^n \text{ with } [A \ I] \cdot \begin{bmatrix} x \\ s \end{bmatrix} = b, \ x \ge 0, \ s \ge 0$$

2.
$$\exists y \in \mathbb{R}^m \text{ with } \begin{bmatrix} A^T \\ I \end{bmatrix} y \ge 0, b^T y < 0$$

5.4 Strong Duality B

94

Proof of Strong Duality

 $z \le w$: follows from weak duality

 $z \geq w$:

95

We show $z < \alpha$ implies $w < \alpha$.

$$\exists x \in \mathbb{R}^n$$
s.t.
$$Ax \leq b$$

$$-c^T x \leq -\alpha$$

$$x > 0$$

$$\exists y \in \mathbb{R}^m; v \in \mathbb{R}$$
s.t. $A^T y - cv \ge 0$

$$b^T y - \alpha v < 0$$

$$y, v \ge 0$$

From the definition of α we know that the first system is infeasible; hence the second must be feasible.

Proof of Strong Duality

$$\exists y \in \mathbb{R}^m; v \in \mathbb{R}$$
s.t.
$$A^T y - v \ge 0$$

$$b^T y - \alpha v < 0$$

$$y, v \ge 0$$

If the solution y, v has v = 0 we have that

$$\exists y \in \mathbb{R}^m$$
s.t. $A^T y \ge 0$

$$b^T y < 0$$

$$y \ge 0$$

is feasible. By Farkas lemma this gives that LP ${\cal P}$ is infeasible. Contradiction to the assumption of the lemma.

Fundamental Questions

Definition 9 (Linear Programming Problem (LP))

Let $A \in \mathbb{Q}^{m \times n}$, $b \in \mathbb{Q}^m$, $c \in \mathbb{Q}^n$, $\alpha \in \mathbb{Q}$. Does there exist $x \in \mathbb{Q}^n$ s.t. Ax = b, $x \ge 0$, $c^T x \ge \alpha$?

Questions:

- ► Is LP in NP?
- ▶ Is LP in co-NP? yes!
- ▶ Is I P in P?

Proof:

- Given a primal maximization problem P and a parameter α . Suppose that $\alpha > \operatorname{opt}(P)$.
- ▶ We can prove this by providing an optimal basis for the dual.
- A verifier can check that the associated dual solution fulfills all dual constraints and that it has dual cost $< \alpha$.

EADS II © Harald Räcke

Proof of Strong Duality

Hence, there exists a solution y, v with v > 0.

We can rescale this solution (scaling both γ and ν) s.t. $\nu = 1$.

Then y is feasible for the dual but $b^Ty < \alpha$. This means that $w < \alpha$.
