[16] Adrian Bock, Elyot Grant, Jochen Könemann, and Laura Sanità. The school bus problem the school bus problem is an np-hard vehicle routing problem in which the goal is to route buses that transport children to a school such that for each child, the distance travelled on the bus does not

exceed the shortest distance from the child's home to the school by more than a given regret threshold. subject to this constraint and bus capacity limit, the goal is to minimize the number of buses required. in this paper, we give a polynomial time 4-approximation algorithm when the children and school are located at vertices of a fixed tree. as a byproduct of our analysis, we show that the integrality gap of the natural set-cover formulation for this problem is also bounded by 4. we also present a constant approximation for the variant where we have a fixed number of buses to use, and the goal is to minimize the maximum regret.on trees.
