A Fast Matching Algorithm

We call one iteration of the repeat-loop a phase of the algorithm.

Lemma 98

Given a matching M and a maximal matching M^* there exist $|M^*| - |M|$ vertex-disjoint augmenting path w.r.t. M.

- Similar to the proof that a matching is optimal iff it does not contain an augmenting paths.
- Consider the graph $G = (V, M \in M^*)$, and mark edges in this graph blue if they are in M and red if they are in M^* .
- The connected components of G are cycles and paths.
- The graph contains $k \cong |M^*| = |M|$ more red edges than a blue edges.
- Hence, there are at least k components that form a path starting and ending with a blue edge. These are augmenting webs (0.25.1)

Lemma 99

The set $A \cong M \oplus (M' \oplus P) = (P_1 \cup \cdots \cup P_k) \oplus P$ contains at least $(k+1)\ell$ edges.

Proof.

- The set describes exactly the symmetric difference between matchings M and $M' \oplus P$.
- ► Hence, the set contains at least k + 1 vertex-disjoint augmenting paths w.r.t. M as |M'| = |M| + k + 1.
- Each of these paths is of length at least ℓ .

Lemma 100

P is of length at least $\ell + 1$. This shows that the length of a shortest augmenting path increases between two phases of the Hopcroft-Karp algorithm.

Proof.

- If P does not intersect any of the P₁, ..., P₆, this follows from the maximality of the set {P₁, ..., P₆}.
- Otherwise, at least one edge from P coincides with an edge from paths (P₁,...,P₂).
- This edge is not contained in A.
- Hence, $|A| \leq k\ell + |P| 1$.
- The lower bound on |A| gives $(k+1)/k \le |A| \le kk+|P| = 1$, and hence $|P| \ge k+1$.

If the shortest augmenting path w.r.t. a matching M has ℓ edges then the cardinality of the maximum matching is of size at most $|M + |\frac{|V|}{\ell+1}$.

Proof.

The symmetric difference between M and M^* contains $|M^*| - |M|$ vertex-disjoint augmenting paths. Each of these paths contains at least $\ell + 1$ vertices. Hence, there can be at most $\frac{|V|}{\ell+1}$ of them.

If the shortest augmenting path w.r.t. a matching M has ℓ edges then the cardinality of the maximum matching is of size at most $|M + |\frac{|V|}{\ell+1}$.

Proof.

The symmetric difference between M and M^* contains $|M^*| - |M|$ vertex-disjoint augmenting paths. Each of these paths contains at least $\ell + 1$ vertices. Hence, there can be at most $\frac{|V|}{\ell+1}$ of them.

Lemma 101

The Hopcroft-Karp algorithm requires at most $2\sqrt{|V|}$ phases.

Proof.

- ► After iteration $\lfloor \sqrt{|V|} \rfloor$ the length of a shortest augmenting path must be at least $\lfloor \sqrt{|V|} \rfloor + 1 \ge \sqrt{|V|}$.
- ► Hence, there can be at most $|V|/(\sqrt{|V|} + 1) \le \sqrt{|V|}$ additional augmentations.

Lemma 101

The Hopcroft-Karp algorithm requires at most $2\sqrt{|V|}$ phases.

- ► After iteration $\lfloor \sqrt{|V|} \rfloor$ the length of a shortest augmenting path must be at least $\lfloor \sqrt{|V|} \rfloor + 1 \ge \sqrt{|V|}$.
- ► Hence, there can be at most $|V|/(\sqrt{|V|} + 1) \le \sqrt{|V|}$ additional augmentations.

Lemma 102

One phase of the Hopcroft-Karp algorithm can be implemented in time O(m).
