How to find an augmenting path?

Construct an alternating tree.

even nodes

Case 4:

y is already contained in T as an even vertex

can't ignore y

The cycle $w \leftrightarrow y - x \leftrightarrow w$ is called a blossom. w is called the base of the blossom (even node!!!). The path u - w path is called the stem of the blossom.

Flowers and Blossoms

Definition 9

A flower in a graph G = (V, E) w.r.t. a matching M and a (free) root node r, is a subgraph with two components:

- A stem is an even length alternating path that starts at the root node r and terminates at some node w. We permit the possibility that r = w (empty stem).
- ▶ A blossom is an odd length alternating cycle that starts and terminates at the terminal node *w* of a stem and has no other node in common with the stem. *w* is called the base of the blossom.

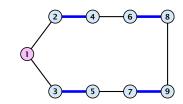

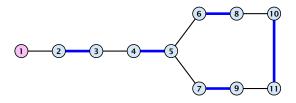

21 Maximum Matching in General Graphs

589

591

Flowers and Blossoms

Flowers and Blossoms

Properties:

- 1. A stem spans $2\ell+1$ nodes and contains ℓ matched edges for some integer $\ell \geq 0$.
- **2.** A blossom spans 2k + 1 nodes and contains k matched edges for some integer $k \ge 1$. The matched edges match all nodes of the blossom except the base.
- **3.** The base of a blossom is an even node (if the stem is part of an alternating tree starting at r).

Flowers and Blossoms

Properties:

- **4.** Every node x in the blossom (except its base) is reachable from the root (or from the base of the blossom) through two distinct alternating paths; one with even and one with odd length.
- 5. The even alternating path to x terminates with a matched edge and the odd path with an unmatched edge.

Shrinking Blossoms

When during the alternating tree construction we discover a blossom B we replace the graph G by G' = G/B, which is obtained from *G* by contracting the blossom *B*.

- ▶ Delete all vertices in *B* (and its incident edges) from *G*.
- Add a new (pseudo-)vertex b. The new vertex b is connected to all vertices in $V \setminus B$ that had at least one edge to a vertex from B.

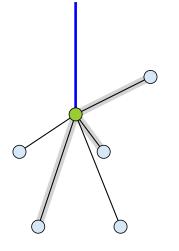

Shrinking Blossoms

- ightharpoonup Edges of T that connect a node unot in B to a node in B become tree edges in T' connecting u to b.
- Matching edges (there is at most one) that connect a node u not in B to a node in B become matching edges in M'.
- Nodes that are connected in G to at least one node in B become connected to b in G'.

Shrinking Blossoms

- ightharpoonup Edges of T that connect a node unot in B to a node in B become tree edges in T' connecting u to b.
- ► Matching edges (there is at most one) that connect a node u not in B to a node in B become matching edges in M'.
- ▶ Nodes that are connected in *G* to at least one node in B become connected to b in G'.

Correctness

Assume that in G we have a flower w.r.t. matching M. Let r be the root, B the blossom, and w the base. Let graph G' = G/Bwith pseudonode b. Let M' be the matching in the contracted graph.

Lemma 10

If G' contains an augmenting path P' starting at r (or the pseudo-node containing r) w.r.t. the matching M' then Gcontains an augmenting path starting at r w.r.t. matching M.

Correctness

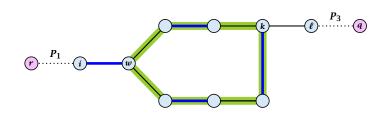

Proof.

If P' does not contain b it is also an augmenting path in G.

Case 1: non-empty stem

Next suppose that the stem is non-empty.

© Ernst Mayr, Harald Räcke

21 Maximum Matching in General Graphs

Correctness

- \blacktriangleright After the expansion ℓ must be incident to some node in the blossom. Let this node be k.
- If $k \neq w$ there is an alternating path P_2 from w to k that ends in a matching edge.
- ▶ $P_1 \circ (i, w) \circ P_2 \circ (k, \ell) \circ P_3$ is an alternating path.
- ▶ If k = w then $P_1 \circ (i, w) \circ (w, \ell) \circ P_3$ is an alternating path.

599

Correctness

Lemma 11

If G contains an augmenting path P from r to g w.r.t. matching M then G' contains an augmenting path from r (or the pseudo-node containing r) to q w.r.t. M'.

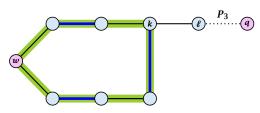

Correctness

Proof.

Case 2: empty stem

▶ If the stem is empty then after expanding the blossom, w = r.

▶ The path $r \circ P_2 \circ (k, \ell) \circ P_3$ is an alternating path.

EADS © Ernst Mayr, Harald Räcke

21 Maximum Matching in General Graphs

600

Correctness

Proof.

- ▶ If *P* does not contain a node from *B* there is nothing to prove.
- We can assume that r and q are the only free nodes in G.

Case 1: empty stem

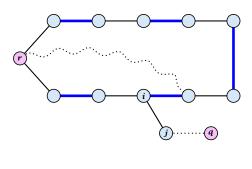

Let i be the last node on the path P that is part of the blossom.

P is of the form $P_1 \circ (i, j) \circ P_2$, for some node j and (i, j) is unmatched.

 $(b, j) \circ P_2$ is an augmenting path in the contracted network.

Correctness

Algorithm 54 search(r, found)

- 1: set $\bar{A}(i) \leftarrow A(i)$ for all nodes i
- 2: *found* ← false
- 3: unlabel all nodes;
- 4: give an even label to r and initialize $list \leftarrow \{r\}$
- 5: while $list \neq \emptyset$ do
- delete a node i from list
- examine(*i*, *found*) 7:
- **if** *found* = true **then return**

Search for an augmenting path starting at r.

The lecture version of the slides has a step by step explanation.

Correctness

Case 2: non-empty stem

Let P_3 be alternating path from r to w; this exists because r and w are root and base of a blossom. Define $M_+ = M \oplus P_3$.

In M_+ , r is matched and w is unmatched.

G must contain an augmenting path w.r.t. matching M_+ , since Mand M_{+} have same cardinality.

This path must go between w and q as these are the only unmatched vertices w.r.t. M_{+} .

For M'_{\perp} the blossom has an empty stem. Case 1 applies.

G' has an augmenting path w.r.t. M'_+ . It must also have an augmenting path w.r.t. M', as both matchings have the same cardinality.

This path must go between r and q.

Algorithm 55 examine(*i*, *found*)

```
1: for all j \in \bar{A}(i) do
```

if j is even then contract(i, j) and return

if i is unmatched then 3:

- $q \leftarrow j$; 4:
- 5: $pred(q) \leftarrow i$;
- *found* ← true; 6:
- 7: return
- if j is matched and unlabeled then 8:
- $pred(j) \leftarrow i$; 9:
- $pred(mate(j)) \leftarrow j$; 10:
- add mate(*j*) to *list* 11:

Examine the neighbours of a node i

The lecture version of the slides has a step by step explanation.

Algorithm 56 contract(i, j)

- 1: trace pred-indices of i and j to identify a blossom B
- 2: create new node b and set $\bar{A}(b) \leftarrow \bigcup_{x \in B} \bar{A}(x)$
- 3: label b even and add to list
- 4: update $\bar{A}(j) \leftarrow \bar{A}(j) \cup \{b\}$ for each $j \in \bar{A}(b)$
- 5: form a circular double linked list of nodes in B
- 6: delete nodes in B from the graph

Contract blossom identified by nodes i and j

Analysis

- ightharpoonup A contraction operation can be performed in time $\mathcal{O}(m)$. Note, that any graph created will have at most m edges.
- ► The time between two contraction-operation is basically a BFS/DFS on a graph. Hence takes time O(m).
- ▶ There are at most *n* contractions as each contraction reduces the number of vertices.
- ▶ The expansion can trivially be done in the same time as needed for all contractions.
- An augmentation requires time O(n). There are at most nof them.
- In total the running time is at most

$$n \cdot (\mathcal{O}(mn) + \mathcal{O}(n)) = \mathcal{O}(mn^2)$$
.
