## Proof sketch

## 1. If $L$ is finite, then it is FO-definable

2. If $L$ is co-finite, then it is FO-definable.

## Proof sketch

3. If $L$ is FO-definable (over a one-letter alphabet), then it is finite or co-finite.
1) We define a new logic QF (quantifier-free fragment)
2) We show that a language is $Q F$-definable iff it is finite or co-finite
3) We show that a language is QF-definable iff it FOdefinable.

## 1) The logic QF

- $x<k \quad x>k$
$x<y+k \quad x>y+k$
$k<$ last $k>$ last
are formulas for every variable $x, y$ and every $k \geq 0$.
- If $f_{1}, f_{2}$ are formulas, then so are $f_{1} \vee f_{2}$ and $f_{1} \wedge f_{2}$

2) $L$ is QF-definable iff it is finite or co-finite
$(\rightarrow)$ Let $f$ be a sentence of QF.
Then $f$ is an and-or combination of formulas
$k<$ last and $k>$ last.
$L(k<$ last $)=\{k+1, k+2, \ldots\}$ is co-finite (we identify words and numbers)
$L(k>$ last $)=\{0,1, \ldots, k\}$ is finite
$L\left(f_{1} \vee f_{2}\right)=L\left(f_{1}\right) \cup L\left(f_{2}\right)$ and so if $L(f)$ and $L(g)$ finite or co-finite the $L$ is finite or co-finite.
$L\left(f_{1} \wedge f_{2}\right)=L\left(f_{1}\right) \cap L\left(f_{2}\right)$ and so if $L(f)$ and $L(g)$ finite or co-finite the $L$ is finite or co-finite.

## 2) $L$ is QF-definable iff it is finite or co-finite

$(\leftarrow)$ If $L=\left\{k_{1}, \ldots, k_{n}\right\}$ is finite, then

$$
\left(k_{1}-1<\text { last } \wedge \text { last }<k_{1}+1\right) \vee \cdots \vee
$$

$$
\left(k_{n}-1<\text { last } \wedge \text { last }<k_{n}+1\right)
$$

expresses $L$.
If $L$ is co-finite, then its complement is finite, and so expressed by some formula. We show that for every $f$ some formula $n e g(f)$ expresses $\overline{L(f)}$

- neg $(k<$ last $)=(k-1<$ last $\wedge$ last $<k+1)$
$\vee$ last $<k$
- $\operatorname{neg}\left(f_{1} \vee f_{2}\right)=n e g\left(f_{1}\right) \wedge n e g\left(f_{2}\right)$
- $\operatorname{neg}\left(f_{1} \wedge f_{2}\right)=\operatorname{neg}\left(f_{1}\right) \vee \operatorname{neg}\left(f_{2}\right)$

3) Every first-order formula $\varphi$ has an equivalent QF-formula $Q F(\varphi)$

- $Q F(x<y)=x<y+0$
- $Q F(\neg \varphi)=\operatorname{neg}(Q F(\varphi))$
- $Q F\left(\varphi_{1} \vee \varphi_{2}\right)=Q F\left(\varphi_{1}\right) \vee Q F\left(\varphi_{2}\right)$
- $Q F\left(\varphi_{1} \wedge \varphi_{2}\right)=Q F\left(\varphi_{1}\right) \wedge Q F\left(\varphi_{2}\right)$
- $Q F(\exists x \varphi)=Q F(\exists x Q F(\varphi))$
- If $Q F(\varphi)$ disjunction, apply $\exists \mathrm{x}\left(\varphi_{1} \vee \ldots \vee \varphi_{n}\right)=$ $\exists \mathrm{x} \varphi_{1} \vee \ldots \vee \exists \mathrm{x} \varphi_{n}$
- If $Q F(\varphi)$ conjunction (or atomic formula), see example in the next slide.
- Consider the formula

$$
\begin{array}{lll}
\exists x & x<y+3 & \wedge \\
& z<x+4 & \wedge \\
z<y+2 & \wedge \\
& y<x+1 &
\end{array}
$$

- The equivalent QF -formula is

$$
z<y+8 \wedge y<y+5 \wedge z<y+2
$$

## M onadic second-order logic

- First-order variables: interpreted on positions
- M onadic second-order variables: interpreted on sets of positions.
- Diadic second-order variables: interpreted on relations over positions
- M onadic third-order variables: interpreted on sets of sets of positions
- New atomic formulas: $x \in X$

## Expressing „even length"

- Express

There is a set $X$ of positions such that

- $X$ contains exactly the even positions, and
- the last position belongs to $X$.
- Express
$X$ contains exactly the even positions
as
A position is in $X$ iff it is second position or the second successor of another position of $X$

## Syntax and semantics of M SO

- New set $\{X, Y, Z, \ldots\}$ of second-order variables
- New syntax: $x \in X$ and $\exists x \varphi$
- New semantics:
- Interpretations now also assign sets of positions to the free second-order variables.
- Satisfaction defined as expected.

## Expressing $c^{*}(a b)^{*} d^{*}$

- Express:

There is a block $X$ of consecutive positions such that

- before $X$ there are only $c$ 's;
- after $X$ there are only $b$ 's;
$-a^{\prime}$ s and $b^{\prime}$ s alternate in $X$;
- the first letter in $X$ is an $a$, and the last is a $b$.
- Then we can take the formula
$\exists X(\operatorname{Cons}(X) \wedge \operatorname{Boc}(X) \wedge \operatorname{Aod}(X) \wedge \operatorname{Alt}(X)$ $\wedge F a(X) \wedge L b(X))$
- $X$ is a block of consecutive positions
- Before $X$ there are only $c$ 's
- In $X a^{\prime} \mathrm{s}$ and $b^{\prime} \mathrm{s}$ alternate

## Every regular language is expressible in M SO logic

- Goal: given an arbitrary regular language $L$, construct an M SO sentence $\varphi$ such having $L=L(\varphi)$.
- We use: if $L$ is regular, then there is a DFA $A$ recognizing $L$.
- Idea: construct a formula expressing the run of $A$ on this word is accepting
- Fix a regular language $L$.
- Fix a DFA $A$ with states $q_{0}, \ldots, q_{n}$ recognizing $L$.
- Fixa word $w=a_{1} a_{2} \ldots a_{m}$.
- Let $P_{q}$ be the set of positions $i$ such that after reading $a_{1} a_{2} \ldots a_{i}$ the automaton $A$ is in state $q$.
- We have:
$A$ accepts $w$ iff $m \in P_{q}$ for some final state $q$.
